In this document we estimate models for money demand and inflation on aggregated Eurozone data following Bårdsen et al. (2005)

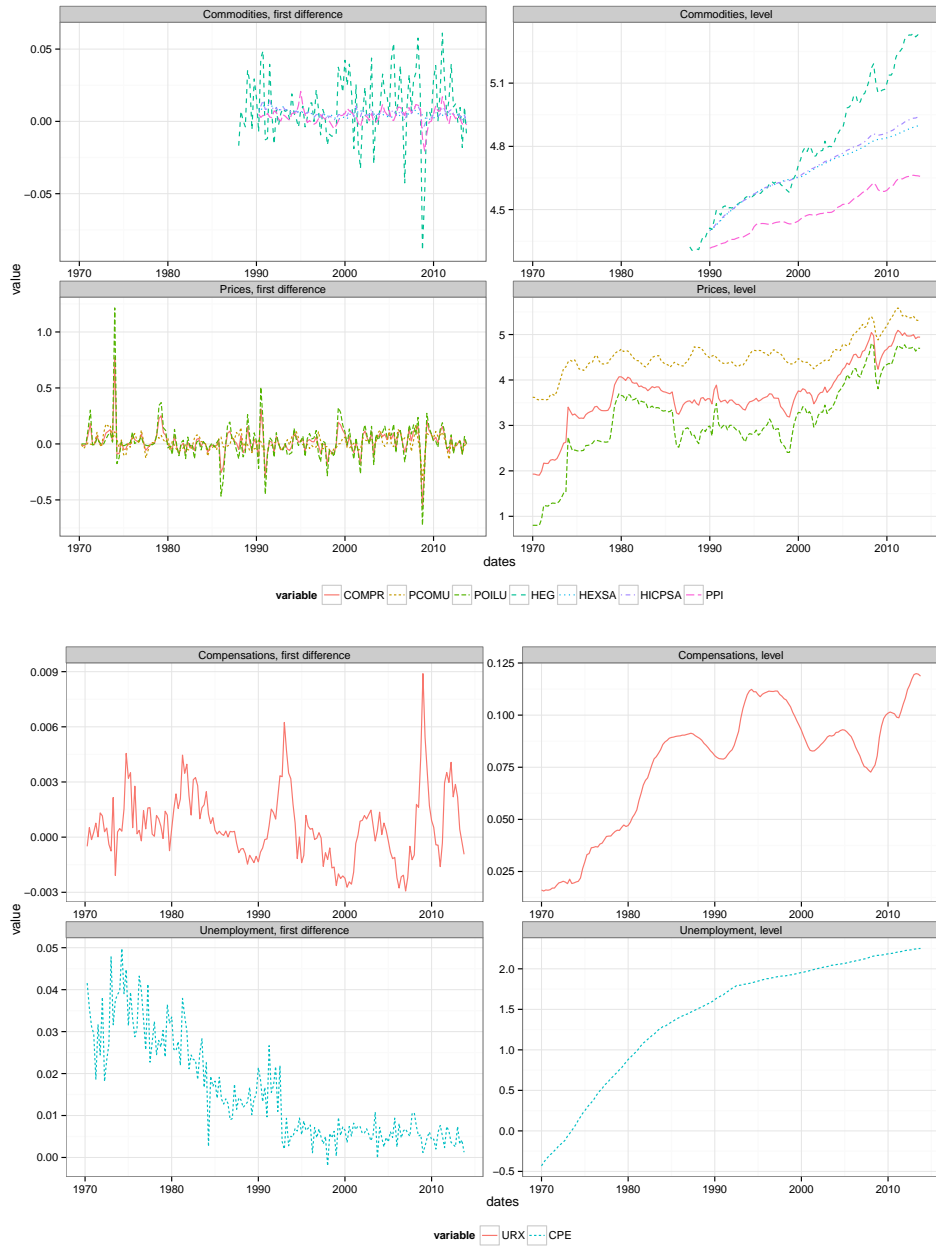

## 1. VISUALISATION OF THE DATA

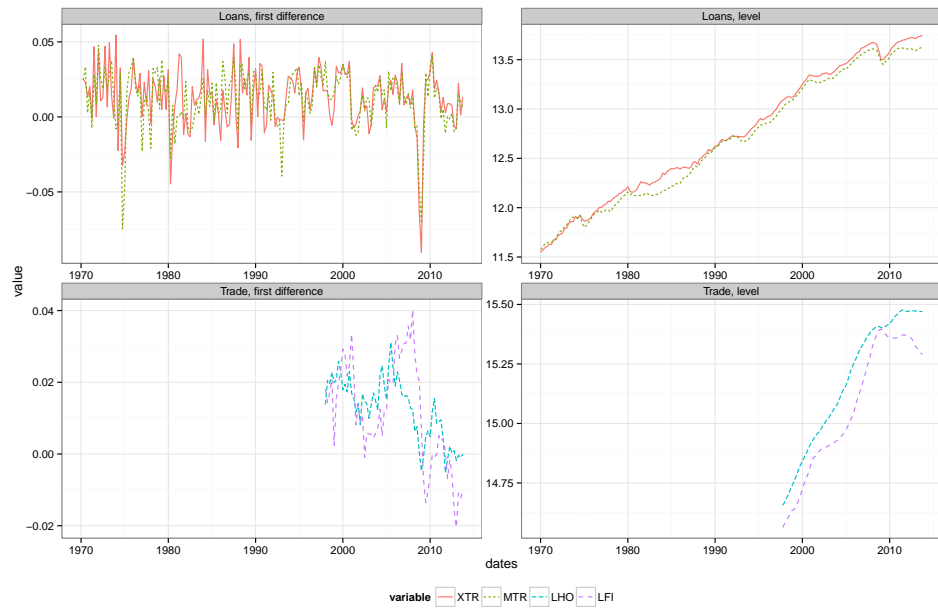

Strong seasonal effect in M1, M3 seems better behaved.

*Date:* July 23, 2015.

# INSPECTION OF THE AWM DATA SET AND ESTIMATION OF EUROZONE AGGREGATED MONEY/INFLATION<sup>2</sup>

# INSPECTION OF THE AWM DATA SET AND ESTIMATION OF EUROZONE AGGREGATED MONEY/INFLATION3

## 2. MONEY DEMAND FUNCTION

Bårdsen et al. (2005) estimates a money demand function on AWM data from 1980:4 to 1997:2. The equation is based on a model from Coenen and Vega (2001) and it includes lagged and contemporaneous variables as well as an error correction term. It has the form:

$$\begin{aligned}\Delta(\widehat{m-p})_t &= \alpha_0 + \alpha_1 \Delta y_t + \alpha_2 \frac{\Delta RS_t + \Delta RS_{t-1}}{2} + \alpha_3 \Delta RL_{t-1} \\ &\quad + \alpha_4 \frac{\Delta pan_t + \Delta pan_{t-1}}{2} + \alpha_5 emc_{t-2}, \\ emc_t &= (m-p)_t + \beta_1 y_t + \beta_2 \Delta pan_t + \beta_3 (RL - RS)_t.\end{aligned}$$

It is a co-integration relation taken from references in (Bårdsen et al., 2005, p. 152).  $RL$  and  $RS$  are the short and long rates from the AWM,  $y_t$  the log of real GDP, and  $\Delta pan$  is the annualized change in the GDP deflator.

Let's try to estimate some variation of it. We do not include an ECM term for starters, and the GDP deflator isn't in the data yet.

```

```

Totally different from the relation in JAE/Baardsen, but then again the modes are totally difference as well.

### 3. INFLATION MODELS
